1. CONCEPT NOTE

This document contains the Structural Analysis of 90' Burner boom and its minor components (padeyes, pins, etc.) installed on Drillship Deepwater Expedition. The Burner boom is located on Aft region of the Drillship.

The objective of the analysis is to verify the structure reliably supports the loads due to Pipes, Burner head, Gratings, Wind, Sprinkler, Hand rails etc mounted on the Burner boom under operational, survival, accidental and lifting condition.

This report serves as verification that Cybermarine drawing no. CT-12-4536-101 complies with structural requirements according to DNV guidelines and American Institute of Steel Construction Specification 9th Edition.

Analysis had been carried out by the Structural Analysis Software SESAM Version 5.0-15. The Computer program verified that stresses are within the allowable limit.

The model plots and section properties are included in **Appendix A** and code check result summary is included in **Appendix C**.

2. MODEL DESCRIPTION

The Boom structure is modeled as Space Frames members.

Accidental condition

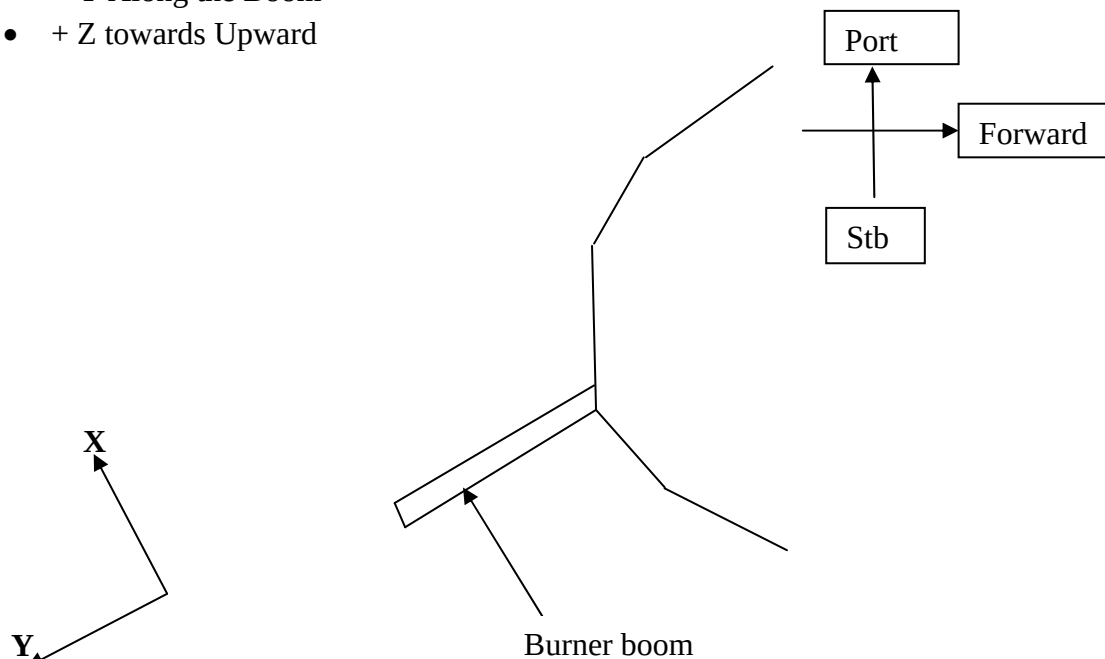

For accidental condition, same model as that operating condition with dry weight of pipelines is used.

Stiffness analysis has been carried out for the Burner boom structure. Analysis includes computation of Resultant Stresses in members due to Bending Stresses, Shear Stresses, Tensile Stresses and Buckling Stresses and checking against the respective acceptable values.

2.1 COORDINATE SYSTEM

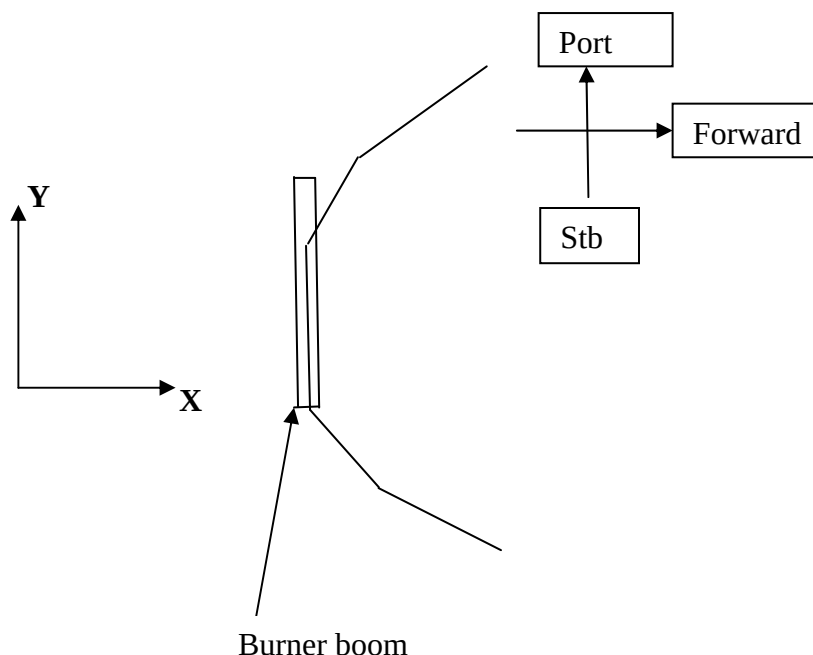

The coordinate system for the model in Operating condition is defined as follows:

- + X towards perpendicular to Boom
- + Y Along the Boom
- + Z towards Upward

The coordinate system for the model in Survival condition is defined as follows:

- + X towards Fwd
- + Y towards Port
- + Z towards Upward

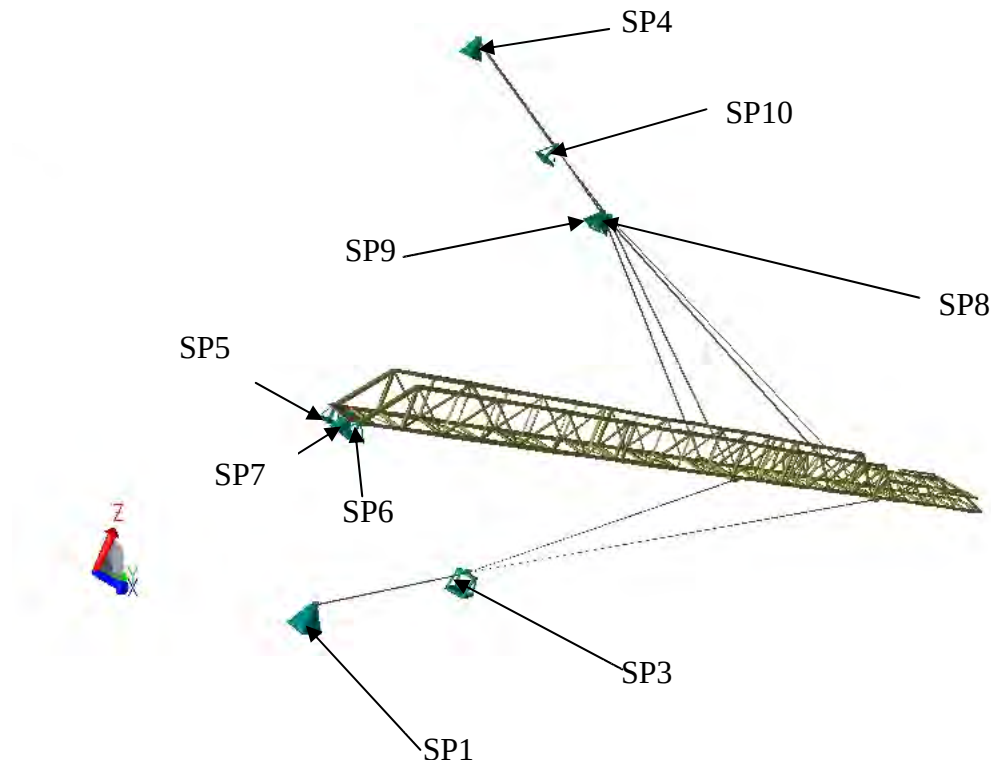

2.2 BOUNDARY CONDITION

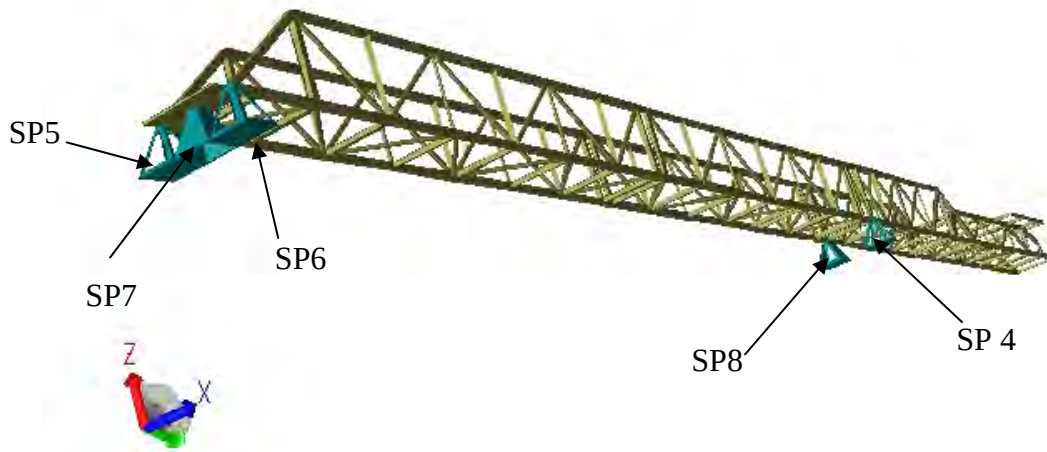

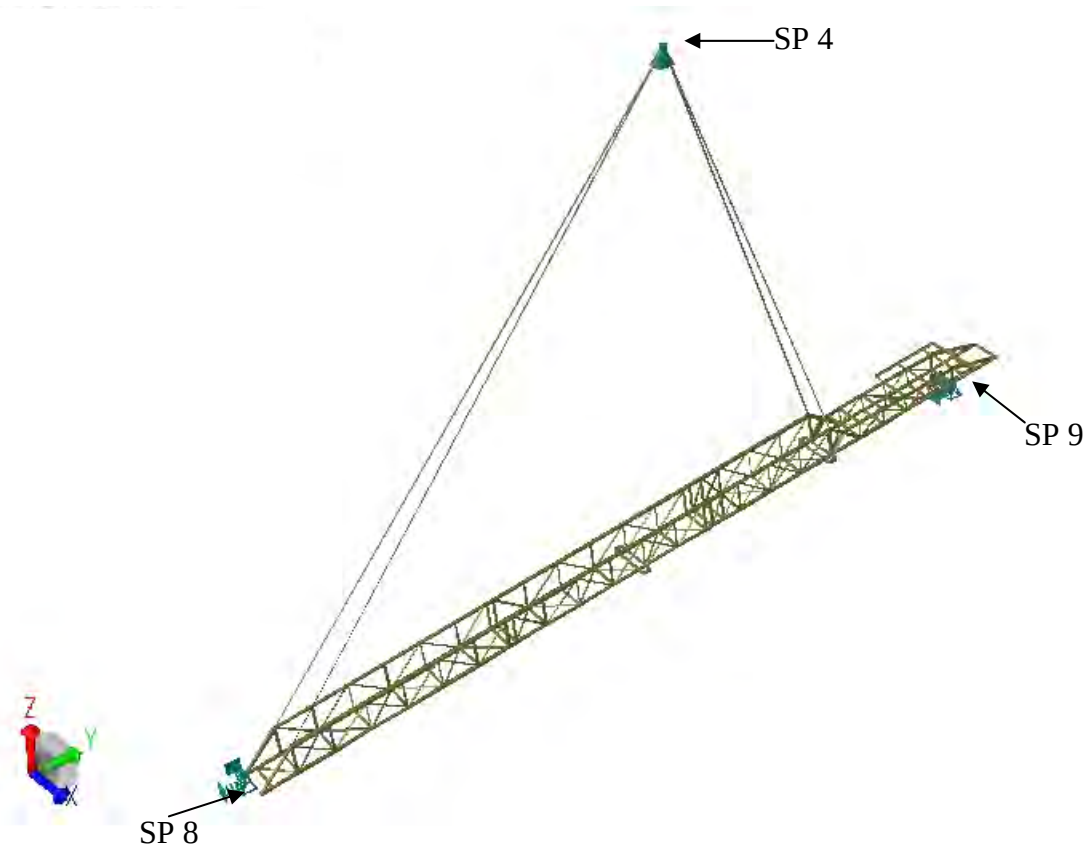

The fig below shows the boundary condition for the model in operating, survival, accidental and lifting conditions. The Burner boom is installed on Transom Stbd side 7850mm off CL. At one end of the burner boom it is supported at Turn table iwo pin to restrict vertical, horizontal and lateral load.

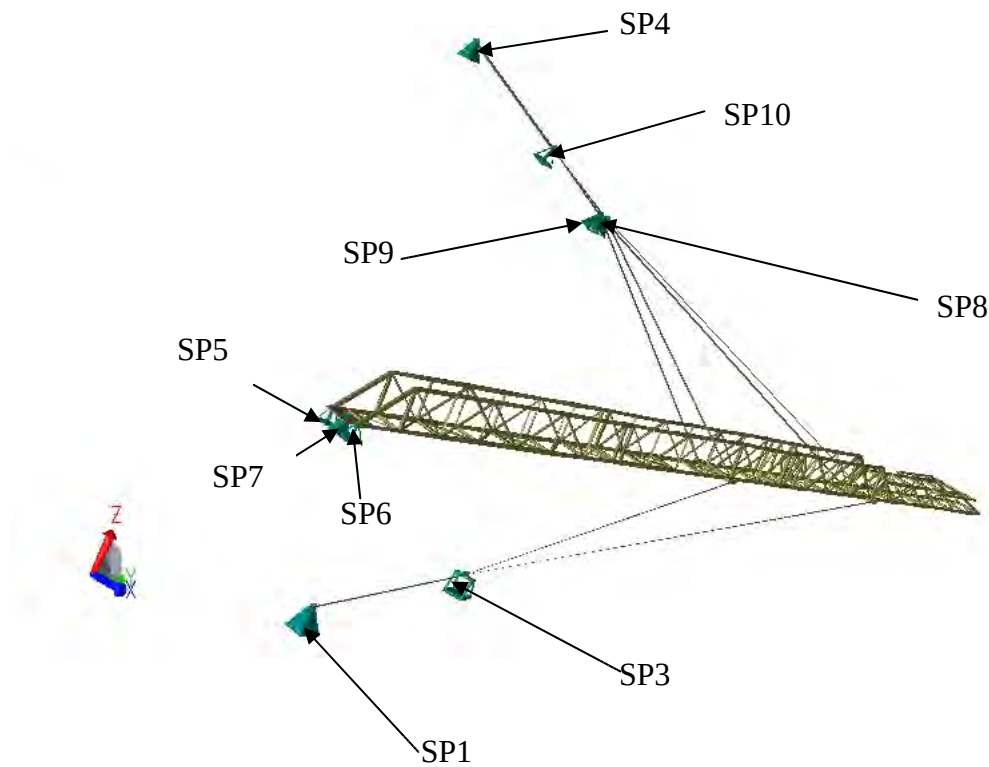

In Operating condition the burner boom is supported vertically at Kingpost Top padeye at height 9.28 m from Poop deck. Also horizontally it is supported at wind stay padeyes at sideshell. Only one side of sling with minimum angle with Boom is modeled for analysis.

In Survival condition the burner boom is supported vertical by two boom rest at 2400 Off CL and 8190 Off CL at aft.

Note: In model, wire ropes are modelled as truss members. Fish plates are idealised as a single joint. Due to instability problem of truss members in lateral direction, dummy supports are introduced in model iwo fish plates joints to stabilize the joint in lateral plane. Magnitude of this reaction is negligible as compared to total reaction iwo other supports.

SURVIVAL CONDITION:**LIFTING CONDITION:**

2.3 ANALYSIS PROCEDURE:

Assumptions for the Analysis are as follows.

1. The structure is assumed to be supported at 5 joints for operating and accidental, 3 corresponding to the Burner Boom turntable, 1 at the ends of lateral guy lines and 1 at the King Post at the end of vertical guy lines. The burner boom is connected to kingpost by four vertical guylines, connected to two separate fishplate and the two vertical guylines connected to these fishplates to a single fishplate and then a single vertical guyline connecting this fishplate to eyepad at kingpost. Similarly in the lateral direction two guylines are connected to single fishplate and then the single guyline connecting this fishplate to eyepad on deck.
2. The Burner Boom is supported at 3 points at Burner Boom turntable, the eyepads at side of Boom provides vertical support, whereas the pin provides horizontal supports. At any instant the lateral guy lines in the windward side of the boom is effective while that on leeward is slack. The guy lines on leeward side are not considered while analysis, as guy lines can't offer the compressive reactions.
3. The guy lines are idealized as space trusses while the boom assembly members as space frames.
4. For operating condition, the yield strength of the materials are reduced to account for the effect of the high temperature. The reduction is calculated with reference to ASTM B31.3
5. The structure is assumed to be supported at Burner boom turntable and boom rest during Survival condition. In survival condition, vertical reactions at supports on boom rest at 2400 Off CL are found to be as negative i.e. the burner boom is not in contact with the boom rest in severe survival condition. Hence the analysis has been carried out with supports only on boom rest at 8190 Off CL.
6. During lifting condition, the burner boom is connected to crane by four vertical guylines. The CG of the burner-boom is exactly below the lifting point of the crane. Two supports with negligible stiffness in horizontal directions are considered to avoid the degree of freedom in the horizontal direction.
7. For Analysis of eyepads, the following load factors are considered in accordance with the applied load.

0 to 5 ton	2
5 to 20 ton	1.75
Above 20 ton	1.5

Load assumptions:

1. The self weight of the boom is amplified by scale factor to account for unmodelled weights like grating, eyepads , flanges, railing etc. Self weight of burner boom is 6.257 kg.
2. The weight of the sprinkler is taken as 640 kg.
3. The weight and wind load pipe line are distributed on the boom at eighteen locations corresponding to vertical bracings as point load.
4. For additional pipeline, the weight and wind load is applied at the tip of the boom as the pipeline continues ahead of boom.
5. In operating condition, the burner loads is applied as 1.55 t equipment load on the boom. In survival, accidental, lifting condition the burner load is considered as 1.2t.
6. The wind load on the Boom is applied as uniformly distributed loads along the length of the members.
7. The temperature load is applied at a range of 250 to 0° C from tip to base of the boom for operating condition.
8. For lifting condition, load factor of 2 is applied to total weight of burner boom.

9. LOADING CONDITIONS:

Analysis has been carried out for the following conditions,

4. RESULT

The performed analysis demonstrates the boom structure meets all required guidelines as per DNV and AISC rules. Induced stresses in Burner boom members are within permissible limits. The Burner boom structure has passed the AISC ASD and API code check. The summary maximum code check value in members for all loading conditions is as follows:

For detailed code check result refer **Annexure 3**.

The reactions iwo Burner boom supports are included in **Annexure 2**.

5. CONCLUSION

The stresses in the Burner boom structure for the Drillship Deepwater Expedition are acceptable and in conformance with DNV guidelines.

Resultant model reaction iwo king post, turn table and wind stay are almost similar to the reaction in CT-12-4536-601, rev 2. As King post, turn table and underdeck iwo same and wind stay pad eyes has been already analysed for the support reaction in CT-12-4536-601,rev 2, reanalysis of the same is not been performed.

Note: For operation condition, the derated properties of material are used to account for the high temperature of burnerboom. The reduced yield strengths are calculated with reference to ASTM B31.3. For survival, accidental and lifting condition, the normal yield strength are used.

i.e HTS and MS properties. For operating conditions HTS_reduced and MS_reduced properties are used.
